Engineering and AI enablement leader with 24 years spanning software engineering, and product delivery. Proven track record of building high-performing teams and shipping mission-critical SaaS platforms at cloud scale. Currently responsible for four product teams (16 engineers) with the help of one senior manager, and standing up three new India-based teams (15 engineers) with local team leads and managers. Consistently recognized for technical leadership, product delivery, and mentorship - by both executives and direct reports.

Recognition & Impact

- Joined as employee #15 and helped scale the organization to 700+ employees and $100M+ in annual recurring revenue, establishing the company as a market leader in cloud file services.
- Recognized for cross-team leadership and deep ownership during key product deliverables, including the launch of the Nasuni Portal, Ransomware Protection, High-Availability/Non-Disruptive Upgrade, and Cloud Migrator.
- Praised by executive leadership for advocacy, high sense of urgency, and ability to build high-performing, collaborative teams.
  Received Uni Award for outstanding employee achievements and contributions.
- Received Engineering Award for leadership, accountability, and technical execution.

Work Experience

Nasuni - Boston, MA | nasuni.com
Software Engineering Director | 2021 - Present
Senior Software Engineering Manager | 2018 - 2021
Software Engineering Manager | 2016 - 2018
Team Lead / Principal Software Engineer | 2014 - 2016
Senior Software Engineer | 2011 - 2014
Software Engineer | 2009 - 2011

- Mentored and developed engineering talent, successfully coaching key individual contributors into management and leadership roles to support organizational scaling.
- Spearheaded the design and deployment of an enterprise test analytics platform integrated with Jenkins, Zephyr, and Jira, tracking millions of CI/CD test results to optimize quality metrics and engineering efficiency (built with Vue.js, Python, Django-Ninja, and SQLite).
- Championed organization-wide AI adoption initiatives, establishing best practices, driving technical readiness, and maximizing developer productivity and innovation ROI.
- Lead the team migrating the product UI from legacy Django jQuery to a more modern SaaS architecture leveraging Python FastAPI, React, and Typescript.
- Responsible for Filer product UI and backend code consisting of Python, Django and Postgres, C, C++ and Javascript. Added multiple new features such a filesystem browser, SNMP tracking, and directory level settings that synchronize across multiple customer installs.
- Design, implement, and maintain Network Operations Center (NOC) tracking customer usage and providing a central API point for all customer installs to coordinate communications. Written primarily in Python and Django. System heavily takes advantage of the AWS infrastructure including 25 EC2 instances, Postgres RDS, Simple Queue Service, Lambda and Redis ElastiCache. Currently tracks and analyses 200 million metrics across several thousand product installs to provide real-time updates to our internal services.

- Develop Nasuni Management Console (NMC) allowing customers to manage and configure multiple products from a single endpoint. System maintained state about each Filer and communicated through the Azure Service Bus.

Hitachi Data Systems - HCP - Boston, MA
Software Engineer | 2006 - 2009

- Responsible for maintaining Python based installer of our main HCAP product. Add new features and debug any problems that arose.
- Lead technical efforts of the test automation group to write and run all automation tests written in Python, Java and Perl provided by the QA team. Responsibilities included code delegation, code review, and reports for oversea hires.
- Maintained and extended abilities of an in-house test scheduler written using Python, PHP and PostgreSQL. Created results management application to track and organize thousands of tests continuously running 24/7.

EMC Corporation - Centera - Boston, MA
Software Engineer | 2004 - 2006

- Create Java based Test Framework. One of three engineers building a Java based automated test framework providing enhancements and adding new features such as automated logging and graphing.
- Design, implement, and maintain PHP/MySQL data mining infrastructure. Proposed a plan to create data mining system after seeing a lack of result analysis from existing tests. Created infrastructure with ability to compute, analyze and graph test results directly from a test run. System provided complete health reports for over 300 test servers running in the lab. Appointed to lead a four man group to enhance and develop more features into the system which is now used by three international groups within the department.

BorgWarner Morse TEC - Ithaca, NY
Software Engineer | 2002 - 2004

- Automate process to measure sound intensity across automotive engines.
- Designed and coded extensive VB.Net application to physically control microphone across a 2D array of user defined data positions while recording and visually graphing sound intensity.

Personal Projects

https://github.com/pkkid

- **Dalica** - Photo management application largely delivered with the use of AI leveraging parallel subagents and a very detailed implementation plan and milestones. Was mostly a learning exercise in how to effectively build larger applications with frontier AI models.
- **Python PlexAPI** - Python bindings for the Plex Media Server with a goal to match capabilities of the official Plex Web Client. Became successful in the open source community.
- **Django SearchQuery** - Advanced yet user-friendly query search capabilities for Django models, currently serving as the dedicated search layer for the Nasuni Management Console.
- **Django DBBackup** - Provider-recommended DB backup and restore strategies for Django databases. This community-maintained project is now a part of the Jazz Band organization on Github.

Education

Northeastern University | MS in Software Engineering | 2012
Rochester Institute of Technology | Bachelor in Computer Engineering | 2004
